It has been accepted for inclusion in Other Publications in Wildlife Management by an authorized administrator of DigitalCommons@University of Nebraska - Lincoln.

PROTEIN PATTERNS

The following electrophoresis patterns are the results of reacting serum, dried blood extract, or tissue extract with an antiserum for that species prepared by injection of serum into a domestic rabbit. The extracts were prepared using physiological saline (0.85% NaCl). An ultrasonic cleaner facilitated putting dried blood in solution. Frozen tissue was homogenized with saline in a Virtis blender. In both cases, samples were centrifuged before application to the agar slide.

Two immuno techniques were initially employed to determine characteristic protein patterns. Ouchterlony double diffusion was one of the techniques utilized. Due to the gross similarities between patterns, they will not be included (see Figure 14). This technique will be employed intensively in the study of cross-reaction patterns.

*Fox antiserum
versus
fox meat extract*

*Mink antiserum
versus
dry mink blood*

*Porcine antiserum
versus
dry pig blood*

*Sheep antiserum
versus
dry sheep blood*

*Golden eagle antiserum
versus
golden eagle dry blood*

*Deer antiserum
versus
dry deer blood*

Figure 14. Examples of similar patterns obtained with Ouchterlony double diffusion.

Characteristic protein patterns using immuno electrophoresis are presented in Figures 15 and 16. Patterns run in other laboratories may differ from ours due to several variables. These include differences between individuals of the same species, ability of various rabbits to produce antiserum, agar concentration, antiserum titer, electrophoresis time, time allowed for diffusion, lab technique, etc.

More species may be added to this series as they become available, but for forensic purposes cross reactions may be of more importance.

Mammals

Antelope	<i>Antilocapra americana</i>
Badger	<i>Taxidea taxus</i>
Beaver	<i>Castor canadensis</i>
Bobcat	<i>Lynx rufus</i>
Buffalo	<i>Bison bison</i>
Cat (domestic)	<i>Felis catus</i>
Cow	
Coyote	<i>Canis latrans</i>
White-tailed Deer	<i>Odocoileus virginianus</i>
Dog	<i>Canis familiaris</i>
Elk	<i>Cervus canadensis</i>
Red Fox	<i>Vulpes vulpes</i>
Human	<i>Homo sapiens</i>
Mink	<i>Mustela vison</i>
Opossum	<i>Didelphis marsupialis</i>
Pig	
Porcupine	<i>Erethizon dorsatum</i>
Prairie Dog	<i>Cynomys ludovicianus</i>
Raccoon	<i>Procyon lotor</i>
Bighorn Sheep	<i>Ovis canadensis</i>
Sheep (domestic)	
Striped Skunk	<i>Mephitis mephitis</i>

Birds

Chicken	<i>Anas platyrhynchos</i>
Mallard Duck	<i>Aquila chrysaetos</i>
Golden Eagle	<i>Chen hyperborea</i>
Snow Goose	<i>Otus asio</i>
Screech Owl	<i>Phasianus colchicus</i>
Ring-necked Pheasant	<i>Columba livia</i>
Pigeon	<i>Meleagris gallopavo</i>
Turkey	

Slides shown are reproduced approximately three times normal size.

Figure 15. The following photographs illustrate the protein patterns formed by reactions to serum antiserum for meat, dry blood, and serum from various species of mammals.
